Theorem 0.11

## Theorem 0.11

**Theorem 0.11.** The image by a continuous map of a compact set is compact.

**Proof.** Let  $K \subset E$  be a compact set. Let  $\{\Omega_i\}_{i \in I}$  be an open covering of  $f(K)$ . Since  $f$  is continuous then, by the definition of “continuous,” each  $f^{-1}(\Omega_i)$  is open in  $E$  and so  $\{f^{-1}(\Omega_i)\}_{i \in I}$  is an open covering of  $K$ . Since  $K$  is compact then, by definition of “compact,” there is finite set  $J \subset I$  such that  $K \subset \bigcup_{i \in J} f^{-1}(\Omega_i)$ . So  $\{\Omega_i\}_{i \in J}$  is a finite subcovering of  $f(K)$ . Since  $\{\Omega_i\}_{i \in I}$  is an arbitrary open covering of  $f(K)$ , then  $f(K)$  is compact as claimed.  $\square$

Proposition 0.8

## Proposition 0.8

**Proposition 0.8.** Any neighborhood  $A$  of  $x \in \overline{B}$  has a nonempty intersection with  $B$ .

**Proof.** Let  $\Omega \subset A$  be an open neighborhood of  $x$  (which exists by the definition of “neighborhood”). ASSUME  $\Omega \cap B = \emptyset$ . Then  $E \setminus \Omega$  is closed and  $B \subset E \setminus \Omega$ . So (by the definition of closure)  $\overline{B} \subset E \setminus \Omega$ . But  $x \in \Omega$  so  $x \in \overline{B}$ , CONTRADICTING the hypothesis that  $x \in \overline{B}$ . So the assumption that  $\Omega \cap B = \emptyset$  is false and hence  $\Omega$  has a nonempty intersection with  $B$  and, since  $\Omega \subset A$ ,  $A$  has a nonempty intersection with  $B$ , as claimed.  $\square$

Theorem 0.1.A

## Theorem 0.1.A

**Theorem 0.1.A.** Let  $E$  and  $F$  be Hausdorff topological spaces. If  $E$  is compact then any continuous  $f : E \rightarrow F$  is proper.

**Proof.** Let  $K \subset F$  be compact. Then by Theorem 0.9,  $K$  is closed. By Note 0.1.A,  $f^{-1}(K)$  is a closed subset of  $E$ . Since  $E$  is compact, by Theorem 0.9  $f^{-1}(K)$  is compact. Therefore, by the definition of “proper,”  $f$  is proper as claimed.  $\square$
