Theorem 6.76.1

## Theorem 6.76.1

**Theorem 6.76.1.** Suppose that

- (a) two functions  $p$  and  $q$  are analytic at a point  $z_0$ , and
- (b)  $p(z_0) \neq 0$  and  $q$  has a zero of order  $m$  at  $z_0$ .

Then the quotient  $p(z)/q(z)$  has a pole of order  $m$  at  $z_0$ .

**Proof.** Since  $q$  has a zero of order  $m$  at  $z_0$  then by Theorem 6.75.2, there is a deleted neighborhood at  $z_0$  throughout which  $q(z) \neq 0$ . So  $p/q$  has an isolated singular point at  $z_0$  and by Theorem 6.75.1, we have  $q(z) = (z - z_0)^m g(z)$  where  $g$  is analytic and nonzero at  $z_0$ . So

$$\frac{p(z)}{q(z)} = \frac{p(z)}{(z - z_0)^m g(z)} = \frac{p(z)/g(z)}{(z - z_0)^m} = \frac{\varphi(z)}{(z - z_0)^m}$$

where  $\varphi(z) = p(z)/q(z)$  is analytic and nonzero (by hypothesis (b)) are  $z_0$ . So by Theorem 6.73.1,  $z_0$  is a pole of order  $m$  of  $p/q$ , as claimed.  $\square$

Theorem 6.76.2

## Theorem 6.76.2

**Theorem 6.76.2.** Let the functions  $p$  and  $q$  be analytic at  $z_0$ . If  $p(z_0) \neq 0$ ,  $q(z_0) = 0$ , and  $q'(z_0) \neq 0$  (that is,  $q$  has a zero of multiplicity one at  $z_0$ ) then  $z_0$  is a simple pole of  $p/q$  and  $\text{Res}_{z=z_0} \frac{p(z)}{q(z)} = \frac{p(z_0)}{q'(z_0)}$ .

**Proof.** By Theorem 6.75.1,  $q(z) = (z - z_0)g(z)$  where  $g$  is analytic and nonzero at  $z_0$ . So by Theorem 6.76.1,  $p/q$  has a simple pole at  $z_0$ . So, as seen in the proof of Theorem 6.76.1,  $\frac{p(z)}{q(z)} = \frac{p(z)/g(z)}{z - z_0} = \frac{\varphi(z)}{z - z_0}$ . So by

Theorem 6.73.1,  $\text{Res}_{z=z_0} \frac{p(z)}{q(z)} = \varphi(z_0) = \frac{p(z_0)}{g(z_0)}$ . But since  $g(z) = (z - z_0)g'(z)$  then  $q'(z) = [1]g(z) + (z - z_0)[g'(z)]$  and  $q'(z_0) = g(z_0)$ , so

$$\text{Res}_{z=z_0} \frac{p(z)}{q(z)} = \frac{p(z_0)}{g(z_0)} = \frac{p(z_0)}{q'(z_0)},$$

as claimed.  $\square$
