Page 160 Number 16.

Page 160 Number 16. Solve the inequality $6x^2 < 6 + 5x$.

Proof. The inequality $6x^2 < 6 + 5x$ is equivalent to the inequality $6x^2 - 5x - 6 < 0$. So we define the quadratic function $f(x) = 6x^2 - 5x - 6$. The graph of y = f(x) opens up (since a = 6 > 0), so we look for the x-intercepts of f (if any) and then we must have f negative (strictly) between the intercepts. So set $f(x) = 6x^2 - 5x - 6 = 0$ and by the quadratic formula we have

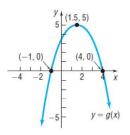

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-(-5) \pm \sqrt{(-5)^2 - 4(6)(-6)}}{2(6)} = \frac{5 \pm \sqrt{25 + 144}}{12}$$
$$= \frac{5 \pm \sqrt{169}}{12} = \frac{5 \pm 13}{12},$$

so we have x-intercepts of (5-13)/12=-8/12=-2/3 and (5+13)/12=18/12=3/2. So f(x)<0 and the original inequality is satisfied for x in (-2/3,3/2).

Page 160 Number 4

Page 160 Number 4. Use the figure to solve each inequality.

(a)
$$g(x) < 0$$
. (b) $g(x) \le 0$.

Solution. (a) We see from the graph that g(x) < 0 when the graph of y = g(x) is below the x-axis, so this is satisfied for the x values in $(-\infty, -1) \cup (4, \infty)$.

(b) For the nonstrict inequality, we include the endpoints in part (a), and we have $g(x) \le 0$ for x values in $(-\infty, -1] \cup [4, \infty)$.

Page 160 Number 3

Page 160 Number 34

Page 160 Number 34. A ball is thrown vertically upward with an initial velocity of 96 feet per second. The distance s (in feet) of the ball from the ground after t seconds is $s(t) = 96t - 16t^2$. (a) At what time t will the ball strike the ground? (b) For what time t is the ball more than 128 feet above the ground?

Solution. (a) The ball strikes the ground when the distance from the ground s is 0, so we consider $s(t) = 96t - 16t^2 = 0$ or 16t(6 - t) = 0. So we have the ball at ground level at t = 0 seconds (when it is first released) and at t = 0 seconds.

(b) We set the distance from the ground $s(t) = 96t - 16t^2$ greater than 128 to get $96t - 16t^2 > 128$ or $-16t^2 + 96t - 128 > 0$. The function $-16t^2 + 96t - 128$ is a quadratic function and its graph opens down (since a = -16 < 0). So this function is positive (that is, greater than 0) between its t-intercepts.

Page 160 Number 34 (continued)

Page 160 Number 34. A ball is thrown vertically upward with an initial velocity of 96 feet per second. The distance s (in feet) of the ball from the ground after t seconds is $s(t) = 96t - 16t^2$. (a) At what time t will the ball strike the ground? (b) For what time t is the ball more than 128 feet above the ground?

Solution. So we set this function equal to 0 and consider $-16t^2 + 96t - 128 = 0$ or $-16(t^2 - 6t + 8) = 0$ or -16(t - 2)(t - 4) = 0. So this function is 0 when t = 2 seconds and t = 4 seconds. Hence, $-16t^2 + 96t - 128 > 0$ and the ball is more than 128 feet from the ground for time t in the interval (2,4).
