Exercise 4.2.1

Exercise 4.2.1

Exercise 4.2.1. Let the observed value of the mean \bar{X} and the sample variance of a random sample of size 20 from a distribution that is $N(\mu, \sigma^2)$ be 81.2 and 25.6, respectively. First, the 90%, 95%, and 99% confidence intervals for μ . Note how the lengths of the confidence intervals increase as the confidence increases.

Solution. We are given $n = 20$, $\bar{x} = 81.2$, and $s = 26.5$. We are interested in $\alpha \in \{0.10, 0.05, 0.01\}$, so we need $t_{\alpha/2, 19}$ for these values. We find (from software or a table) that

$$t_{0.05, 19} = 1.729, \quad t_{0.025, 19} = 2.093, \quad \text{and} \quad t_{0.005, 19} = 2.861,$$

so that the confidence intervals are

$$90\% : (81.2 - 1.729(26.5)/\sqrt{2}, 81.2 + 1.729(26.5)/\sqrt{2}) = (70.95, 91.45),$$

$$95\% : (81.2 - 2.093(26.5)/\sqrt{2}, 81.2 + 2.093(26.5)/\sqrt{2}) = (68.80, 93.60),$$

$$99\% : (81.2 - 2.861(26.5)/\sqrt{2}, 81.2 + 2.861(26.5)/\sqrt{2}) = (64.25, 98.15).$$

Exercise 4.2.1

Exercise 4.2.1 (continued)

Exercise 4.2.1. Let the observed value of the mean \bar{X} and the sample variance of a random sample of size 20 from a distribution that is $N(\mu, \sigma^2)$ be 81.2 and 25.6, respectively. First, the 90%, 95%, and 99% confidence intervals for μ . Note how the lengths of the confidence intervals increase as the confidence increases.

Solution (continued). Since the confidence intervals are

$$90\% : (70.95, 91.45),$$

$$95\% : (68.80, 93.60),$$

$$99\% : (64.25, 98.15),$$

we observe that the greater the confidence, the larger the interval (as we should expect). \square

Exercise 4.2.A

Exercise 4.2.A

Exercise 4.2.A. (From William Navadi's *Statistics for Engineers and Scientists*, 3rd Edition, McGraw-Hill [2011]). In a simple random sample of 70 automobiles registered in a certain state, 28 of them were found to have emission levels that exceed a state standard. Find 95% and 98% confidence intervals for the proportion of automobiles in the state whose emission levels exceed the standard.

Solution. Let X be the Bernoulli random variable X where $X = 1$ when automobile's emission level exceeds the state standard (a "success") and $X = 0$ otherwise. For the sample, we have $n = 70$ and $\bar{X} = 28/70 = 0.40 = \hat{p}$. For $\alpha = 0.05$ we have $z_{\alpha/2} = z_{0.025} = 1.96$, and for $\alpha = 0.02$ we have $z_{\alpha/2} = z_{0.01} = 2.33$. So the 95% confidence interval for the proportion p of automobiles in the state whose emission levels exceed the standard is ...

Exercise 4.2.A (continued)

Exercise 4.2.A. In a simple random sample of 70 automobiles registered in a certain state, 28 of them were found to have emission levels that exceed a state standard. Find 95% and 98% confidence intervals for the proportion of automobiles in the state whose emission levels exceed the standard.

Solution (continued). ...

$$\begin{aligned} & \left(\hat{p} - z_{0.025} \sqrt{\hat{p}(1 - \hat{p})/n}, \hat{p} + z_{0.025} \sqrt{\hat{p}(1 - \hat{p})/n} \right) \\ &= \left(0.40 - 1.96 \sqrt{0.40(1 - 0.40)/70}, 0.40 + 1.96 \sqrt{0.40(1 - 0.40)/70} \right) \\ &= (0.29, 0.51) \end{aligned}$$

and similarly the 98% confidence interval is

$$\begin{aligned} & \left(0.40 - 2.33 \sqrt{0.40(1 - 0.40)/70}, 0.40 + 2.33 \sqrt{0.40(1 - 0.40)/70} \right) \\ &= (0.26, 0.54). \quad \square \end{aligned}$$
