## Theorem 5.2.1

Theorem 5.2.1. If sequence of random variables $\left(X_{n}\right)$ converges to $X$ in probability, then $\left(X_{n}\right)$ converges to $X$ in distribution.

Proof. Let $x$ be a point of continuity of the cumulative distribution function $F_{X}(x)$ and let $\varepsilon>0$. Then

$$
\begin{aligned}
F_{X_{n}}(x)= & P\left(X_{n} \leq x\right) \\
= & P\left(\left(X_{n} \leq x\right) \cap\left(\left\{\left|X_{n}-X\right|<\varepsilon\right\} \cup\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right)\right. \\
= & \left.P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}+P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
= & \left.P\left(X_{n} \leq x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n} \leq x\right) \cap\left\{X-X_{n}<\varepsilon\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
\leq & P(X \leq x+\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \text { since } X_{n} \leq x \text { and } \\
& X-X_{n}<\varepsilon \text { together imply } X \leq X_{n}+\varepsilon \leq x+\varepsilon .
\end{aligned}
$$

## Theorem 5.2.1

Theorem 5.2.1. If sequence of random variables $\left(X_{n}\right)$ converges to $X$ in probability, then $\left(X_{n}\right)$ converges to $X$ in distribution.

Proof. Let $x$ be a point of continuity of the cumulative distribution function $F_{X}(x)$ and let $\varepsilon>0$. Then

$$
\begin{aligned}
F_{X_{n}}(x)= & P\left(X_{n} \leq x\right) \\
= & P\left(\left(X_{n} \leq x\right) \cap\left(\left\{\left|X_{n}-X\right|<\varepsilon\right\} \cup\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right)\right. \\
= & \left.P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}+P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
= & \left.P\left(X_{n} \leq x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n} \leq x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n} \leq x\right) \cap\left\{X-X_{n}<\varepsilon\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
\leq & P(X \leq x+\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \text { since } X_{n} \leq x \text { and } \\
& X-X_{n}<\varepsilon \text { together imply } X \leq X_{n}+\varepsilon \leq x+\varepsilon .
\end{aligned}
$$

## Theorem 5.2.1 (continued 1)

Proof (continued). Since $X_{n} \xrightarrow{P} X$ then be definition $\lim _{n \rightarrow \infty} P\left(\left|X_{n}-\right| \geq \varepsilon\right)=0$, so

$$
\begin{gather*}
\left.\overline{\lim }_{n \rightarrow \infty} F_{n} \leq \varlimsup_{n \rightarrow \infty} P(\mid X \leq x+\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right)\right) \\
=\overline{\lim }_{n \rightarrow \infty} P(X \leq x+\varepsilon)+\overline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
=P(X \leq x+\varepsilon)+0=F_{X}(x+\varepsilon) \tag{5.2.5}
\end{gather*}
$$

Similarly,

$$
\begin{aligned}
P\left(X_{n}>x\right)= & P\left(\left(X_{n}>x\right) \cap\left(\left\{\left|X_{n}-X\right|<\varepsilon\right\} \cup\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right)\right. \\
= & P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
= & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \ldots
\end{aligned}
$$

## Theorem 5.2.1 (continued 1)

Proof (continued). Since $X_{n} \xrightarrow{P} X$ then be definition $\lim _{n \rightarrow \infty} P\left(\left|X_{n}-\right| \geq \varepsilon\right)=0$, so

$$
\begin{gather*}
\left.\varlimsup_{n \rightarrow \infty} F_{n} \leq \varlimsup_{n \rightarrow \infty} P(\mid X \leq x+\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right)\right) \\
=\varlimsup_{n \rightarrow \infty} P(X \leq x+\varepsilon)+\overline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
=P(X \leq x+\varepsilon)+0=F_{X}(x+\varepsilon) \tag{5.2.5}
\end{gather*}
$$

Similarly,

$$
\begin{aligned}
P\left(X_{n}>x\right)= & P\left(\left(X_{n}>x\right) \cap\left(\left\{\left|X_{n}-X\right|<\varepsilon\right\} \cup\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right)\right. \\
= & P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right|<\varepsilon\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
= & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \ldots
\end{aligned}
$$

## Theorem 5.2.1 (continued 2)

## Proof (continued).

$$
\begin{aligned}
P\left(X_{n}>x\right) \leq & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X-X_{n}\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
\leq & P(X \leq x-\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \text { since } X_{n} \leq x \text { and } \\
& -\varepsilon<X-X_{n} \text { together imply } X>X_{n}-\varepsilon>x-\varepsilon .
\end{aligned}
$$

## Therefore,

$$
\begin{align*}
\lim _{n \rightarrow \infty}\left(1-F_{X_{n}}(x)\right) & =1+\lim _{n \rightarrow \infty}\left(-F_{X_{n}}(x)\right)=1-\lim _{n \rightarrow \infty} F_{X_{n}}(x) \\
& =\overline{\lim }_{n \rightarrow \infty}\left(1-F_{X_{n}}(x)\right)=\lim _{n \rightarrow \infty} P\left(X_{n}>x\right) \\
& \leq \lim _{n \rightarrow \infty}\left(P(X \geq x-\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right)\right) \\
& =\lim _{n \rightarrow \infty} P(X \geq x-\varepsilon)+\lim _{n \rightarrow \infty} P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
& =P(X \geq x-\varepsilon)+0=1-F_{X}(x-\varepsilon) . \tag{5.2.6}
\end{align*}
$$

## Theorem 5.2.1 (continued 2)

## Proof (continued).

$$
\begin{aligned}
P\left(X_{n}>x\right) \leq & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X_{n}-X<\varepsilon\right\}\right) \\
& +P\left(\left(X_{n}>x\right) \cap\left\{\left|X_{n}-X\right| \geq \varepsilon\right\}\right) \\
\leq & P\left(\left(X_{n}>x\right) \cap\left\{-\varepsilon<X-X_{n}\right\}\right)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
\leq & P(X \leq x-\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \text { since } X_{n} \leq x \text { and } \\
& -\varepsilon<X-X_{n} \text { together imply } X>X_{n}-\varepsilon>x-\varepsilon .
\end{aligned}
$$

Therefore,

$$
\begin{align*}
\lim _{n \rightarrow \infty}\left(1-F_{X_{n}}(x)\right) & =1+\lim _{n \rightarrow \infty}\left(-F_{X_{n}}(x)\right)=1-\varlimsup_{n \rightarrow \infty} F_{X_{n}}(x) \\
& =\varlimsup_{n \rightarrow \infty}\left(1-F_{X_{n}}(x)\right)=\varlimsup_{n \rightarrow \infty} P\left(X_{n}>x\right) \\
& \leq \varlimsup_{n \rightarrow \infty}\left(P(X \geq x-\varepsilon)+P\left(\left|X_{n}-X\right| \geq \varepsilon\right)\right) \\
& =\varlimsup_{n \rightarrow \infty} P(X \geq x-\varepsilon)+\varlimsup_{n \rightarrow \infty} P\left(\left|X_{n}-X\right| \geq \varepsilon\right) \\
& =P(X \geq x-\varepsilon)+0=1-F_{X}(x-\varepsilon) . \tag{5.2.6}
\end{align*}
$$

## Theorem 5.2.1 (continued 3)

Theorem 5.2.1. If sequence of random variables $\left(X_{n}\right)$ converges to $X$ in probability, then $\left(X_{n}\right)$ converges to $X$ in distribution.

Proof (continued). Combining (5.2.5) and (5.2.6), we get

$$
F_{X}(x-\varepsilon) \leq \lim _{n \rightarrow \infty} F_{X_{n}}(x) \leq \varlimsup_{n \rightarrow \infty} F_{X_{n}}(x) \leq F_{X}(x+\varepsilon) .
$$

Since $\varepsilon>0$ is arbitrary and since $x$ is a point of continuity of $F_{X}$ then we must have

$$
\lim _{n \rightarrow \infty} F_{X_{n}}(x) \text { exists and } \lim _{n \rightarrow \infty} F_{X_{n}}(x)=F_{X}(x)
$$

Since $x$ is an arbitrary element of $C\left(F_{X}\right)$, then $X_{n}$ converges in distribution to $X$ (by definition), as claimed.

## Theorem 5.2.2

Theorem 5.2.2. If sequence of random variables $\left(X_{n}\right)$ converges to constant $b$ in distribution, then $\left(X_{n}\right)$ converges to $b$ in probability.

Proof. Let $\varepsilon>0$. Since $X_{n} \xrightarrow{D} b$ by hypothesis then
$\lim _{n \rightarrow \infty} F_{X_{n}}(x)=F_{X}(x)=b$ for all $x \in C\left(F_{X}\right)$. So

$$
\lim _{n \rightarrow \infty} P\left(\left|X_{n}-b\right| \leq \varepsilon\right)=\lim _{n \rightarrow \infty} P\left(-\varepsilon \leq X_{n}-b \leq \varepsilon\right)
$$

$$
\begin{aligned}
& =\lim _{n \rightarrow \infty} P\left(b-\varepsilon \leq X_{n} \leq b+\varepsilon\right)=\lim _{n \rightarrow \infty}\left(P\left(X_{n} \leq b+\varepsilon\right)-P\left(X_{n}<b-\varepsilon\right)\right) \\
& =\lim _{n \rightarrow \infty}\left(P\left(X_{n} \leq b+\varepsilon\right)-P\left(X_{n} \leq b-\varepsilon\right)+P\left(X_{n}-b-\varepsilon\right)\right) \\
& =\lim _{n \rightarrow \infty} F_{X_{n}}(b+\varepsilon)=\lim _{n \rightarrow \infty} F_{X_{n}}(b-\varepsilon)+\lim _{n \rightarrow \infty} P\left(X_{n}=b-\varepsilon\right) \\
& =1-0+\lim _{n \rightarrow \infty} P\left(X_{n}=b-\varepsilon\right) \text { since } \lim _{n \rightarrow \infty} F_{X_{n}}(x)=b \\
& =1 \text { since a limit of probabilities must be at most } 1 .
\end{aligned}
$$

(Notice that we must have $\left.\lim _{n \rightarrow \infty} P(X=b-\varepsilon)=0\right)$. Therefore, by definition, $X_{n} \xrightarrow{P} b$, as claimed.

## Theorem 5.2.2

Theorem 5.2.2. If sequence of random variables $\left(X_{n}\right)$ converges to constant $b$ in distribution, then $\left(X_{n}\right)$ converges to $b$ in probability.
Proof. Let $\varepsilon>0$. Since $X_{n} \xrightarrow{D} b$ by hypothesis then $\lim _{n \rightarrow \infty} F_{X_{n}}(x)=F_{X}(x)=b$ for all $x \in C\left(F_{X}\right)$. So

$$
\lim _{n \rightarrow \infty} P\left(\left|X_{n}-b\right| \leq \varepsilon\right)=\lim _{n \rightarrow \infty} P\left(-\varepsilon \leq X_{n}-b \leq \varepsilon\right)
$$

$=\lim _{n \rightarrow \infty} P\left(b-\varepsilon \leq X_{n} \leq b+\varepsilon\right)=\lim _{n \rightarrow \infty}\left(P\left(X_{n} \leq b+\varepsilon\right)-P\left(X_{n}<b-\varepsilon\right)\right)$
$=\lim _{n \rightarrow \infty}\left(P\left(X_{n} \leq b+\varepsilon\right)-P\left(X_{n} \leq b-\varepsilon\right)+P\left(X_{n}-b-\varepsilon\right)\right)$
$=\lim _{n \rightarrow \infty} F_{X_{n}}(b+\varepsilon)=\lim _{n \rightarrow \infty} F_{X_{n}}(b-\varepsilon)+\lim _{n \rightarrow \infty} P\left(X_{n}=b-\varepsilon\right)$
$=1-0+\lim _{n \rightarrow \infty} P\left(X_{n}=b-\varepsilon\right)$ since $\lim _{n \rightarrow \infty} F_{X_{n}}(x)=b$
$=1$ since a limit of probabilities must be at most 1 .
(Notice that we must have $\left.\lim _{n \rightarrow \infty} P(X=b-\varepsilon)=0\right)$. Therefore, by definition, $X_{n} \xrightarrow{P} b$, as claimed.

## Theorem 5.2.6

Theorem 5.2.6. Let $\left(X_{n}\right)$ be a sequence of random variables and let $X$ be a random variable. If $X_{n} \rightarrow X$ in distribution, then $\left(X_{n}\right)$ is bounded in probability.

Proof. Consider the cumulative distribution functions $F_{X_{n}}$ and $F_{X}$. Let $\varepsilon>0$ be given and choose $\eta$ so that $\eta$ and $-\eta$ are continuity points of $F_{X}$ and $P(|X| \leq \eta) \geq 1-\varepsilon$, as described in equation (5.2.7). Now

$$
\begin{aligned}
\lim _{n \rightarrow \infty} P\left(\left|X_{n}\right| \leq \eta\right) & =\lim _{n \rightarrow \infty}\left(F_{X_{n}}(\eta)-F_{X_{n}}(-\eta)+P\left(X_{n}=-\eta\right)\right) \text { by (5.2.7) } \\
& \geq \lim _{n \rightarrow \infty} F_{X_{n}}(\eta)-\lim _{n \rightarrow \infty} F_{X_{n}}(-\eta)+0 \\
& =F_{X}(\eta)-F_{X}(-\eta) \text { since } X_{n} \xrightarrow{D} X \\
& >1-\varepsilon \text { by }(5.2 .7) .
\end{aligned}
$$

## Theorem 5.2.6

Theorem 5.2.6. Let $\left(X_{n}\right)$ be a sequence of random variables and let $X$ be a random variable. If $X_{n} \rightarrow X$ in distribution, then $\left(X_{n}\right)$ is bounded in probability.

Proof. Consider the cumulative distribution functions $F_{X_{n}}$ and $F_{X}$. Let $\varepsilon>0$ be given and choose $\eta$ so that $\eta$ and $-\eta$ are continuity points of $F_{X}$ and $P(|X| \leq \eta) \geq 1-\varepsilon$, as described in equation (5.2.7). Now

$$
\begin{aligned}
\lim _{n \rightarrow \infty} P\left(\left|X_{n}\right| \leq \eta\right) & =\lim _{n \rightarrow \infty}\left(F_{X_{n}}(\eta)-F_{X_{n}}(-\eta)+P\left(X_{n}=-\eta\right)\right) \text { by (5.2.7) } \\
& \geq \lim _{n \rightarrow \infty} F_{X_{n}}(\eta)-\lim _{n \rightarrow \infty} F_{X_{n}}(-\eta)+0 \\
& =F_{X}(\eta)-F_{X}(-\eta) \text { since } X_{n} \xrightarrow{D} X \\
& >1-\varepsilon \text { by }(5.2 .7) .
\end{aligned}
$$

So with $B_{\varepsilon}=\eta$ there exists $N_{\varepsilon} \in \mathbb{N}$ such that for all $\eta \geq N_{\varepsilon}$ we have $P\left(\left|X_{n}\right| \leq X_{\varepsilon}\right) \geq 1-\varepsilon$ and so $\left(X_{n}\right)$ is bounded in probability, as

## Theorem 5.2.6

Theorem 5.2.6. Let $\left(X_{n}\right)$ be a sequence of random variables and let $X$ be a random variable. If $X_{n} \rightarrow X$ in distribution, then $\left(X_{n}\right)$ is bounded in probability.
Proof. Consider the cumulative distribution functions $F_{X_{n}}$ and $F_{X}$. Let $\varepsilon>0$ be given and choose $\eta$ so that $\eta$ and $-\eta$ are continuity points of $F_{X}$ and $P(|X| \leq \eta) \geq 1-\varepsilon$, as described in equation (5.2.7). Now

$$
\begin{aligned}
\lim _{n \rightarrow \infty} P\left(\left|X_{n}\right| \leq \eta\right) & =\lim _{n \rightarrow \infty}\left(F_{X_{n}}(\eta)-F_{X_{n}}(-\eta)+P\left(X_{n}=-\eta\right)\right) \text { by }(5.2 .7) \\
& \geq \lim _{n \rightarrow \infty} F_{X_{n}}(\eta)-\lim _{n \rightarrow \infty} F_{X_{n}}(-\eta)+0 \\
& =F_{X}(\eta)-F_{X}(-\eta) \text { since } X_{n} \xrightarrow{D} X \\
& >1-\varepsilon \text { by }(5.2 .7)
\end{aligned}
$$

So with $B_{\varepsilon}=\eta$ there exists $N_{\varepsilon} \in \mathbb{N}$ such that for all $\eta \geq N_{\varepsilon}$ we have $P\left(\left|X_{n}\right| \leq X_{\varepsilon}\right) \geq 1-\varepsilon$ and so $\left(X_{n}\right)$ is bounded in probability, as claimed.

## Theorem 5.2.7

Theorem 5.2.7. Let $\left(X_{n}\right)$ be a sequence of random variables which is bounded in probability and let $\left(Y_{n}\right)$ be a sequence of random variables that converges to 0 in probability. Then $X_{n} Y_{n} \xrightarrow{P} 0$.

Proof. Since $\varepsilon>0$. Since $\left(X_{n}\right)$ is bounded in probability by hypothesis then there exists $B_{\varepsilon}>0$ and $N_{\varepsilon} \in \mathbb{N}$ such that
$n \geq N_{\varepsilon}$ implies $P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \geq 1-\varepsilon$.

## Theorem 5.2.7

Theorem 5.2.7. Let $\left(X_{n}\right)$ be a sequence of random variables which is bounded in probability and let $\left(Y_{n}\right)$ be a sequence of random variables that converges to 0 in probability. Then $X_{n} Y_{n} \xrightarrow{P} 0$.

Proof. Since $\varepsilon>0$. Since $\left(X_{n}\right)$ is bounded in probability by hypothesis then there exists $B_{\varepsilon}>0$ and $N_{\varepsilon} \in \mathbb{N}$ such that

$$
n \geq N_{\varepsilon} \text { implies } P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \geq 1-\varepsilon .
$$

## Then

$\varlimsup_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=\lim _{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{N}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \cup\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right)$
$=\overline{\lim }_{n \rightarrow \infty}\left(P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\mid X_{n}>B_{\varepsilon}\right)\right)\right.$
$\leq \overline{\lim }_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+\overline{\lim _{n \rightarrow \infty}} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right)$

## Theorem 5.2.7

Theorem 5.2.7. Let $\left(X_{n}\right)$ be a sequence of random variables which is bounded in probability and let $\left(Y_{n}\right)$ be a sequence of random variables that converges to 0 in probability. Then $X_{n} Y_{n} \xrightarrow{P} 0$.

Proof. Since $\varepsilon>0$. Since $\left(X_{n}\right)$ is bounded in probability by hypothesis then there exists $B_{\varepsilon}>0$ and $N_{\varepsilon} \in \mathbb{N}$ such that

$$
n \geq N_{\varepsilon} \text { implies } P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \geq 1-\varepsilon .
$$

Then

$$
\begin{aligned}
& \overline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=\overline{\lim }_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{N}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \cup\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right) \\
& =\overline{\lim }_{n \rightarrow \infty}\left(P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\mid X_{n}>B_{\varepsilon}\right)\right)\right. \\
& \leq \overline{\lim }_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+\overline{\lim }_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right)
\end{aligned}
$$

## Theorem 5.2.7 (continued)

## Proof (continued). ...

$\leq \varlimsup_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+\varlimsup_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right)$
$\leq \varlimsup_{n \rightarrow \infty} P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right)+\varlimsup_{n \rightarrow \infty} P\left(\left|X_{n}\right|>B_{\varepsilon}\right)$ since $\left|X_{n}\right|>B_{\varepsilon}$ implies $1 /\left|X_{n}\right|<1 / B_{\varepsilon}$ so that $P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=P\left(\left|Y_{n}\right| \geq \varepsilon /\left|X_{n}\right|\right)$
$\geq P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right)$ since $\varepsilon / B_{\varepsilon}>\varepsilon /\left|X_{n}\right|$
$\leq \varlimsup_{n \rightarrow \infty} P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right.$ since $P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \geq 1-\varepsilon$ implies $\varepsilon \geq 1-P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)=P\left(\left|X_{n}\right|>B_{\varepsilon}\right)$
$=0+\varepsilon=\varepsilon$ since $Y_{N} \xrightarrow{P} 0$.
So $\overline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$ and, since $P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \geq 0$, then $\underline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$. Hence $\lim _{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$ so that, by definition of convergence in probability, $X_{n} Y_{n} \xrightarrow{P} 0$, as claimed.

## Theorem 5.2.7 (continued)

## Proof (continued). ...

$\leq \varlimsup_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)\right)+\varlimsup_{n \rightarrow \infty} P\left(\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \cap\left(\left|X_{n}\right|>B_{\varepsilon}\right)\right)$
$\leq \lim _{n \rightarrow \infty} P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right)+\varlimsup_{n \rightarrow \infty} P\left(\left|X_{n}\right|>B_{\varepsilon}\right)$ since $\left|X_{n}\right|>B_{\varepsilon}$ implies $1 /\left|X_{n}\right|<1 / B_{\varepsilon}$ so that $P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=P\left(\left|Y_{n}\right| \geq \varepsilon /\left|X_{n}\right|\right)$ $\geq P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right)$ since $\varepsilon / B_{\varepsilon}>\varepsilon /\left|X_{n}\right|$
$\leq \varlimsup_{n \rightarrow \infty} P\left(\left|Y_{n}\right| \geq \varepsilon / B_{\varepsilon}\right.$ since $P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right) \geq 1-\varepsilon$ implies $\varepsilon \geq 1-P\left(\left|X_{n}\right| \leq B_{\varepsilon}\right)=P\left(\left|X_{n}\right|>B_{\varepsilon}\right)$
$=0+\varepsilon=\varepsilon$ since $Y_{N} \xrightarrow{P} 0$.
So $\varlimsup_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$ and, since $P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right) \geq 0$, then $\underline{\lim }_{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$. Hence $\lim _{n \rightarrow \infty} P\left(\left|X_{n} Y_{n}\right| \geq \varepsilon\right)=0$ so that, by definition of convergence in probability, $X_{n} Y_{n} \xrightarrow{P} 0$, as claimed.

## Theorem 5.2.8

Theorem 5.2.8. Suppose sequence of random variables $\left(Y_{n}\right)$ is bounded in probability. Suppose $X_{n}=o_{p}\left(Y_{n}\right)$. Then $X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$.

Proof. Let $\varepsilon>0$ and let $\varepsilon^{\prime}>0$. Since $\left(Y_{n}\right)$ is bounded in probability by hypothesis, then (by definition) there events $N_{\varepsilon^{\prime}} \in \mathbb{N}$ and $B_{\varepsilon^{\prime}}>0$ such that if $n \geq N_{\varepsilon^{\prime}}$ then $P\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right) \geq a-\varepsilon^{\prime} / 2$. Also, since $X_{n}=o_{p}\left(Y_{n}\right)$ by hypothesis then (by definition) $X_{n} / Y_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$; that is, $\lim _{n \rightarrow \infty} P\left(\left|S_{n} / Y_{n}\right| \geq \varepsilon\right)=0$. So there is $N_{1} \in \mathbb{N}$ such that for all $n \geq N_{1}$ we have $P\left(\left|X_{n} / Y_{n}\right| \geq \varepsilon / B_{\varepsilon^{\prime}}\right)<\varepsilon^{\prime} / 2$.

## Theorem 5.2.8

Theorem 5.2.8. Suppose sequence of random variables $\left(Y_{n}\right)$ is bounded in probability. Suppose $X_{n}=o_{p}\left(Y_{n}\right)$. Then $X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$.

Proof. Let $\varepsilon>0$ and let $\varepsilon^{\prime}>0$. Since $\left(Y_{n}\right)$ is bounded in probability by hypothesis, then (by definition) there events $N_{\varepsilon^{\prime}} \in \mathbb{N}$ and $B_{\varepsilon^{\prime}}>0$ such that if $n \geq N_{\varepsilon^{\prime}}$ then $P\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right) \geq a-\varepsilon^{\prime} / 2$. Also, since $X_{n}=o_{p}\left(Y_{n}\right)$ by hypothesis then (by definition) $X_{n} / Y_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$; that is, $\lim _{n \rightarrow \infty} P\left(\left|S_{n} / Y_{n}\right| \geq \varepsilon\right)=0$. So there is $N_{1} \in \mathbb{N}$ such that for all $n \geq N_{1}$ we have $P\left(\left|X_{n} / Y_{n}\right| \geq \varepsilon / B_{\varepsilon^{\prime}}\right)<\varepsilon^{\prime} / 2$. Let $N=\max \left\{N_{\varepsilon^{\prime}}, N_{1}\right\}$. Then for $n \geq N$ we have
$P\left(\left|X_{n}\right| \geq \varepsilon\right)=P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right) \cap\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right)\right)\right.$
$=P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right)\right)+P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right)\right)$
$\leq P\left(\left|X_{n}\right| / Y_{n} \mid \geq \varepsilon / B_{\varepsilon^{\prime}}\right)+P\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right)$ since $\left|X_{n}\right| \geq \varepsilon$ and $\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}$ implies $\left|X_{n} / Y_{n}\right| \geq \varepsilon / B_{\varepsilon^{\prime}}$

## Theorem 5.2.8

Theorem 5.2.8. Suppose sequence of random variables $\left(Y_{n}\right)$ is bounded in probability. Suppose $X_{n}=o_{p}\left(Y_{n}\right)$. Then $X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$.

Proof. Let $\varepsilon>0$ and let $\varepsilon^{\prime}>0$. Since $\left(Y_{n}\right)$ is bounded in probability by hypothesis, then (by definition) there events $N_{\varepsilon^{\prime}} \in \mathbb{N}$ and $B_{\varepsilon^{\prime}}>0$ such that if $n \geq N_{\varepsilon^{\prime}}$ then $P\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right) \geq a-\varepsilon^{\prime} / 2$. Also, since $X_{n}=o_{p}\left(Y_{n}\right)$ by hypothesis then (by definition) $X_{n} / Y_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$; that is, $\lim _{n \rightarrow \infty} P\left(\left|S_{n} / Y_{n}\right| \geq \varepsilon\right)=0$. So there is $N_{1} \in \mathbb{N}$ such that for all $n \geq N_{1}$ we have $P\left(\left|X_{n} / Y_{n}\right| \geq \varepsilon / B_{\varepsilon^{\prime}}\right)<\varepsilon^{\prime} / 2$. Let $N=\max \left\{N_{\varepsilon^{\prime}}, N_{1}\right\}$. Then for $n \geq N$ we have

$$
\begin{aligned}
P\left(\left|X_{n}\right| \geq \varepsilon\right)= & P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right) \cap\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right)\right)\right. \\
= & P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right)\right)+P\left(\left(\left|X_{n}\right| \geq \varepsilon\right) \cap\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right)\right) \\
\leq & P\left(\left|X_{n}\right| / Y_{n} \mid \geq \varepsilon / B_{\varepsilon^{\prime}}\right)+P\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right) \text { since }\left|X_{n}\right| \geq \varepsilon \\
& \quad \text { and }\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}} \text { implies }\left|X_{n} / Y_{n}\right| \geq \varepsilon / B_{\varepsilon^{\prime}}
\end{aligned}
$$

## Theorem 5.2.8 (continued)

Theorem 5.2.8. Suppose sequence of random variables $\left(Y_{n}\right)$ is bounded in probability. Suppose $X_{n}=o_{p}\left(Y_{n}\right)$. Then $X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$.

Proof (continued). . .

$$
\begin{aligned}
P\left(\left|X_{n}\right| \geq \varepsilon\right) & \leq P\left(\left|X_{n}\right| / Y_{n} \mid \geq \varepsilon / B_{\varepsilon^{\prime}}\right)+P\left(\left|Y_{n}\right|>B_{\varepsilon^{\prime}}\right) \\
& <\varepsilon^{\prime} / 2+\left(1-P\left(\left|Y_{n}\right| \leq B_{\varepsilon^{\prime}}\right)\right)<\varepsilon^{\prime} / 2+\left(1-\left(1-\varepsilon^{\prime} / 2\right)\right) \\
& =\varepsilon^{\prime} / 2+\varepsilon^{\prime} / 2=\varepsilon^{\prime}
\end{aligned}
$$

Since $\varepsilon^{\prime}>0$ is arbitrary, then $\lim _{n \rightarrow \infty} P\left(\left|X_{n}\right| \geq \varepsilon\right)=0$ and so $X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$, as claimed.

## Theorem 5.2.9

Theorem 5.2.9. Let $\left(X_{n}\right)$ be a sequence of random variables which that $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$. Suppose the function $g(x)$ is differentiable at $\theta$ and $g^{\prime}(\theta) \neq 0$. Then

$$
\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right) .
$$

Proof. By "Theorem 5.2.A. A General Mean Value Theorem" we have

$$
g\left(X_{n}\right)=g(\theta)+g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

$$
g\left(X_{n}\right)-g(\theta)=g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

or

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+\sqrt{n} o_{p}\left(\left|X_{n}-\theta\right|\right) .
$$

## Theorem 5.2.9

Theorem 5.2.9. Let $\left(X_{n}\right)$ be a sequence of random variables which that $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$. Suppose the function $g(x)$ is differentiable at $\theta$ and $g^{\prime}(\theta) \neq 0$. Then

$$
\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right) .
$$

Proof. By "Theorem 5.2.A. A General Mean Value Theorem" we have

$$
g\left(X_{n}\right)=g(\theta)+g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

or

$$
g\left(X_{n}\right)-g(\theta)=g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

or

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+\sqrt{n} o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

Now $Y_{n}=o_{p}\left(X_{n}\right)$ means $Y_{n} / X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$ (or
$\left.\lim _{n \rightarrow \infty} P\left(\left|Y_{n} / X_{n}\right| \geq \varepsilon\right)=0\right)$, so $Y_{n}=o_{p}\left(\sqrt{n} X_{n}\right)$ since $\lim _{n \rightarrow \infty} P\left(\left|Y_{n} /\left(\sqrt{n} X_{n}\right)\right| \geq \varepsilon\right)=0$.

## Theorem 5.2.9

Theorem 5.2.9. Let $\left(X_{n}\right)$ be a sequence of random variables which that $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$. Suppose the function $g(x)$ is differentiable at $\theta$ and $g^{\prime}(\theta) \neq 0$. Then

$$
\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right) .
$$

Proof. By "Theorem 5.2.A. A General Mean Value Theorem" we have

$$
g\left(X_{n}\right)=g(\theta)+g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

or

$$
g\left(X_{n}\right)-g(\theta)=g^{\prime}(\theta)\left(X_{n}-\theta\right)+o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

or

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+\sqrt{n} o_{p}\left(\left|X_{n}-\theta\right|\right)
$$

Now $Y_{n}=o_{p}\left(X_{n}\right)$ means $Y_{n} / X_{n} \xrightarrow{P} 0$ as $n \rightarrow \infty$ (or $\left.\lim _{n \rightarrow \infty} P\left(\left|Y_{n} / X_{n}\right| \geq \varepsilon\right)=0\right)$, so $Y_{n}=o_{p}\left(\sqrt{n} X_{n}\right)$ since $\lim _{n \rightarrow \infty} P\left(\left|Y_{n} /\left(\sqrt{n} X_{n}\right)\right| \geq \varepsilon\right)=0$.

## Theorem 5.2.9 (continued)

Proof (continued). Hence

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right)
$$

Since $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$, then by Theorem 5.2.6 $\sqrt{n}\left(X_{n}-\theta\right)$ is bounded in probability and hence so is $\sqrt{n}\left|X_{n}-\theta\right|$. By Theorem 5.2.8 (since $\sqrt{n}\left|X_{n}=\theta\right|$ is bounded in probability) then $o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right) \xrightarrow{P} 0$ as $n \rightarrow \infty$ which, by Theorem 5.2.1. Therefore,
$\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right)$. That is, $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$ and $o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right) \xrightarrow{P} 0$, so by Theorem 2.5.2 (Slutsky's Theorem),

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} g^{\prime}(\theta) N\left(0, \sigma^{2}\right)+0 .
$$

Now $g^{\prime}(\theta) N\left(0, \sigma^{2}\right)=N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right)$ by Theorem 2.4.2, therefore $\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right)$, as claimed.

## Theorem 5.2.9 (continued)

Proof (continued). Hence

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right)
$$

Since $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$, then by Theorem 5.2.6 $\sqrt{n}\left(X_{n}-\theta\right)$ is bounded in probability and hence so is $\sqrt{n}\left|X_{n}-\theta\right|$. By Theorem 5.2.8 (since $\sqrt{n}\left|X_{n}=\theta\right|$ is bounded in probability) then $o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right) \xrightarrow{P} 0$ as $n \rightarrow \infty$ which, by Theorem 5.2.1. Therefore,
$\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right)=g^{\prime}(\theta) \sqrt{n}\left(X_{n}-\theta\right)+o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right)$.
That is, $\sqrt{n}\left(X_{n}-\theta\right) \xrightarrow{D} N\left(0, \sigma^{2}\right)$ and $o_{p}\left(\sqrt{n}\left|X_{n}-\theta\right|\right) \xrightarrow{P} 0$, so by Theorem 2.5.2 (Slutsky's Theorem),

$$
\sqrt{n} g\left(X_{n}\right)-\sqrt{n} g(\theta)=\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} g^{\prime}(\theta) N\left(0, \sigma^{2}\right)+0 .
$$

Now $g^{\prime}(\theta) N\left(0, \sigma^{2}\right)=N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right)$ by Theorem 2.4.2, therefore $\sqrt{n}\left(g\left(X_{n}\right)-g(\theta)\right) \xrightarrow{D} N\left(0, \sigma^{2}\left(g^{\prime}(\theta)\right)^{2}\right)$, as claimed.
