

Theorem 1.10.1 (continued)

Theorem 1.10.1. For any events A_1, A_2, A_3 we have

$$\begin{aligned} \Pr(A_1 \cup A_2 \cup A_3) &= \Pr(A_1) + \Pr(A_2) + \Pr(A_3) - \Pr(A_1 \cap A_2) \\ &\quad - \Pr(A_2 \cap A_3) - \Pr(A_1 \cap A_3) + \Pr(A_1 \cap A_2 \cap A_3). \end{aligned}$$

Proof (continued).

$$\Pr(A_1 \cup A_2 \cup A_3)$$

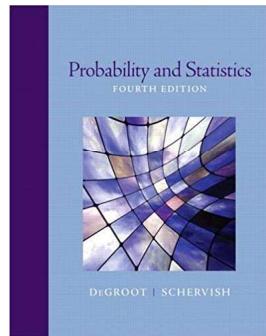

$$\begin{aligned} &= \Pr(A_1) + \Pr(A_2) + \Pr(A_3) - \Pr(A_1 \cap A_2) \\ &\quad - (\Pr(A_1 \cap A_3) + \Pr(A_2 \cap A_3) - \Pr(A_1 \cap A_2 \cap A_3)) \text{ by Theorem 1.5.7} \\ &= \Pr(A_1) + \Pr(A_2) + \Pr(A_3) - \Pr(A_1 \cap A_2) - \Pr(A_2 \cap A_3) \\ &\quad - \Pr(A_1 \cap A_3) + \Pr(A_1 \cap A_2 \cap A_3), \end{aligned}$$

as claimed. □

Chapter 1. Introduction to Probability

1.10. The Probability of a Union of Events—Proofs of Theorems

Theorem 1.10.2

Theorem 1.10.2. For any n events A_1, A_2, \dots, A_n we have

$$\begin{aligned} \Pr(\cup_{i=1}^n A_i) &= \sum_{i=1}^n \Pr(A_i) - \sum_{i < j} \Pr(A_i \cap A_j) + \sum_{i < j < k} \Pr(A_i \cap A_j \cap A_k) \\ &\quad - \sum_{i < j < k < \ell} \Pr(A_i \cap A_j \cap A_k \cap A_\ell) + \cdots + (-1)^{n+1} \Pr(A_1 \cap A_2 \cap \cdots \cap A_n). \end{aligned}$$

Proof. The result holds trivially for $n = 1$, holds by Theorem 1.5.7 for $n = 2$, and holds by Theorem 1.10.1 for $n = 3$. We now prove the result by mathematical induction. Suppose the result holds for all $n \leq m$. Let A_1, A_2, \dots, A_{m+1} be events. Define $A = \cup_{i=1}^m A_i$ and $B = A_{m+1}$. Then

$$\begin{aligned} \Pr(\cup_{i=1}^{m+1} A_i) &= \Pr(A \cup B) = \Pr(A) + \Pr(B) - \Pr(A \cap B) \\ &\quad \text{by Theorem 1.5.7} \\ &= \Pr(\cup_{i=1}^m A_i) + \Pr(A_{m+1}) - \Pr((\cup_{i=1}^m A_i) \cap A_{m+1}) \end{aligned}$$

Theorem 1.10.2 (continued 1)

Proof (continued). . . .

$$\begin{aligned} &= \Pr(\cup_{i=1}^m A_i) + \Pr(A_{m+1}) - \Pr(\cup_{i=1}^m (A_i \cap A_{m+1})) \\ &\quad \text{by Theorem 1.4.10, Distributive Property, and induction} \\ &= \left(\sum_{i=1}^m \Pr(A_i) - \sum_{i < j \leq m} \Pr(A_i \cap A_j) + \sum_{i < j < k \leq m} \Pr(A_i \cap A_j \cap A_k) \right. \\ &\quad - \sum_{i < j < k < \ell \leq m} \Pr(A_i \cap A_j \cap A_k \cap A_\ell) + \cdots \\ &\quad \left. + (-1)^{m+1} \Pr(A_1 \cap A_2 \cap \cdots \cap A_m) \right) + \Pr(A_{m+1}) \\ &\quad - \left(\sum_{i=1}^m \Pr(A_i \cap A_{m+1}) - \sum_{i < j \leq m} \Pr(A_i \cap A_j \cap A_{m+1}) \cdots \right. \end{aligned}$$

Theorem 1.10.2 (continued 2)

Proof (continued). . . .

$$\begin{aligned}
 & + \sum_{i < j < k \leq m} \Pr(A_i \cap A_j \cap A_k \cap A_{m+1}) \\
 & - \sum_{i < j < k < \ell \leq m} \Pr(A_i \cap A_j \cap A_k \cap A_\ell \cap A_{m+1}) + \cdots \\
 & + (-1)^{m+1} \Pr(A_1 \cap A_2 \cap \cdots \cap A_m \cap A_{m+1}) \Big) \text{ by induction hypothesis} \\
 = & \sum_{i=1}^{m+1} \Pr(A_i) - \sum_{i < j \leq m+1} \Pr(A_i \cap A_j) + \sum_{i < j < k \leq m+1} \Pr(A_i \cap A_j \cap A_k) \\
 & - \sum_{i < j < k < \ell \leq m+1} \Pr(A_i \cap A_j \cap A_k \cap A_\ell) + \cdots \\
 & + (-1)^{m+2} \Pr(A_1 \cap A_2 \cap \cdots \cap A_m \cap A_{m+1}),
 \end{aligned}$$

so result holds for $n = m + 1$ and, by induction, holds for $n \in \mathbb{N}$. □
