Functions

Reading: Kolman, Section 5.1

Domain and Range of a Relation

The following definitions assume R is a relation from A to B .

- $\text{Dom}(R)$ = subset of A representing elements of A that make sense for R . This is called the “domain of R .”
- $\text{Ran}(R)$ = subset of B that lists all second elements of R . This is called the “range of R .”

Functions

- A function f is a relation from A to B where each element of A that is in the domain of f maps to **exactly** one element, b , in B
- Denoted $f(a) = b$
- If an element a is not in the domain of f , then $f(a) = \emptyset$

Functions (continued)

Also called mappings or transformations because they can be viewed as rules that assign each element of A to a single element of B .

Functions (continued)

- Since f is a relation, then it is a subset of the Cartesian Product $A \times B$.
- Even though there might be multiple sequence pairs that have the same element b , no two sequence pairs may have the same element a .

Functions Represented with Formulas

- It may be possible to represent a function with a formula
- Example: $f(x) = x^2$ (mapping from \mathbb{Z} to \mathbb{N})
- Since function is a relation which is a subset of the Cartesian product, then it doesn't need to be represented with a formula.
- A function may just be a list of sequenced pairs

Functions not Representable with Formulas

- Example: A mapping from one finite set to another
 - $A = \{a, b, c, d\}$ and $B = \{4, 6\}$
 - $f(a) = \{(a, 4), (b, 6), (c, 6), (d, 4)\}$
- Example: Membership functions
 - $f(a) = \{0 \text{ if } a \text{ is even and } 1 \text{ if } a \text{ is odd}\}$
 - $A = \mathbb{Z}$ and $B = \{0, 1\}$

Labeled Digraphs

- A labeled digraph is a digraph in which the vertices or the edges or both are labelled with information from a set.
- A labeled digraph can be represented with functions

Examples of Labeled Digraphs

- Distances between cities:
 - vertices are cities
 - edges are distances between cities
- Organizational Charts
 - vertices are employees
- Trouble shooting flow chart
- State diagrams

Labeled Digraphs (continued)

- If V is the set of vertices and L is the set of labels of a labelled digraph, then the labelling of V can be specified by a function $f: V \rightarrow L$ where for each $v \in V$, $f(v)$ is the label we wish to attach to v .
- If E is the set of edges and L is the set of labels of a labelled digraph, then the labelling of E can be specified to be a function $g: E \rightarrow L$ where for each $e \in E$, $g(e)$ is the label we wish to attach to e .

Identity function

- The identity function is a function on A
- Denoted 1_A
- Defined by $1_A(a) = a$
- 1_A is represented as a subset of $A \times A$ with the identity matrix

Composition

- If $f: A \rightarrow B$ and $g: B \rightarrow C$, then the composition of f and g , $g \circ f$, is a relation.
- Let $a \in \text{Dom}(g \circ f)$.
 - $(g \circ f)(a) = g(f(a))$
 - If $f(a)$ maps to exactly one element, say $b \in B$, then $g(f(a)) = g(b)$
 - If $g(b)$ also maps to exactly one element, say $c \in C$, then $g(f(a)) = c$
 - Thus for each $a \in A$, $(g \circ f)(a)$ maps to exactly one element of C and $g \circ f$ is a function

Special types of functions

- f is “**everywhere defined**” if $\text{Dom}(f) = A$
- f is “**onto**” if $\text{Ran}(f) = B$
- f is “**one-to-one**” if it is impossible to have $f(a) = f(a')$ if $a \neq a'$, i.e., if $f(a) = f(a')$, then $a = a'$
- $f: A \rightarrow B$ is “**invertible**” if its inverse function f^{-1} is also a function. (Note, f^{-1} is simply the reversing of the ordered pairs)

Theorems of Functions

- Let $f: A \rightarrow B$ be a function; f^{-1} is a function from B to A if and only if f is one-to-one
- If f^{-1} is a function, then the function f^{-1} is also one-to-one
- f^{-1} is everywhere defined if and only if f is onto
- f^{-1} is onto if and only if f is everywhere defined

Another Theorem of Functions

If f is everywhere defined, one-to-one, and onto, then f is a one-to-one correspondence between A & B . Thus f is invertible and f^{-1} is a one-to-one correspondence between B & A .

More Theorems of Functions

- Let f be any function:
 - $1_B \circ f = f$
 - $f \circ 1_A = f$
- If f is a one-to-one correspondence between A and B , then
 - $f^{-1} \circ f = 1_A$
 - $f \circ f^{-1} = 1_B$
- Let $f: A \rightarrow B$ and $g: B \rightarrow C$ be invertible.
 - $(g \circ f)$ is invertible
 - $(g \circ f)^{-1} = (f^{-1} \circ g^{-1})$

Finite sets

- Let A and B both be finite sets with the same number of elements
- If $f: A \rightarrow B$ is everywhere defined, then
 - If f is one-to-one, then f is onto
 - If f is onto, then f is one-to-one
